Verify TCP/IP listen ports

Check web server & system performance

Monitor Event Logs, IIS and related log files

Real-time alerts, notifications & auto-responses

Web reporting built-in

Compatible with Sentry-go Plus! components

Ensuring your presence on-line!

Today, the ability to access to your web sites quickly and efficiently is often vital to your success. Whether it's for remote staff working, business to business communication or customers on-line, a failure that goes unnoticed here can cause more than an error in a web browser. Checking this in today's 24 hour world is both time consuming and impractical; automating such a solution is however, just a few clicks away with the Sentry-go Quick Web Monitor!

Put simply, this Quick Monitor does exactly what you want to do, but many times a day. Effectively automating a web browser, it can check the availability of your key sites and pages, ensure a response within a given timeframe and even check that the page returned contains the details you expect.

Of course, web systems today are much more than just a few HTML pages, they can encompass FTP file transfers and other IP-related activity and so the Quick Monitor verifies these too, 24 x 7, 365 days a year!

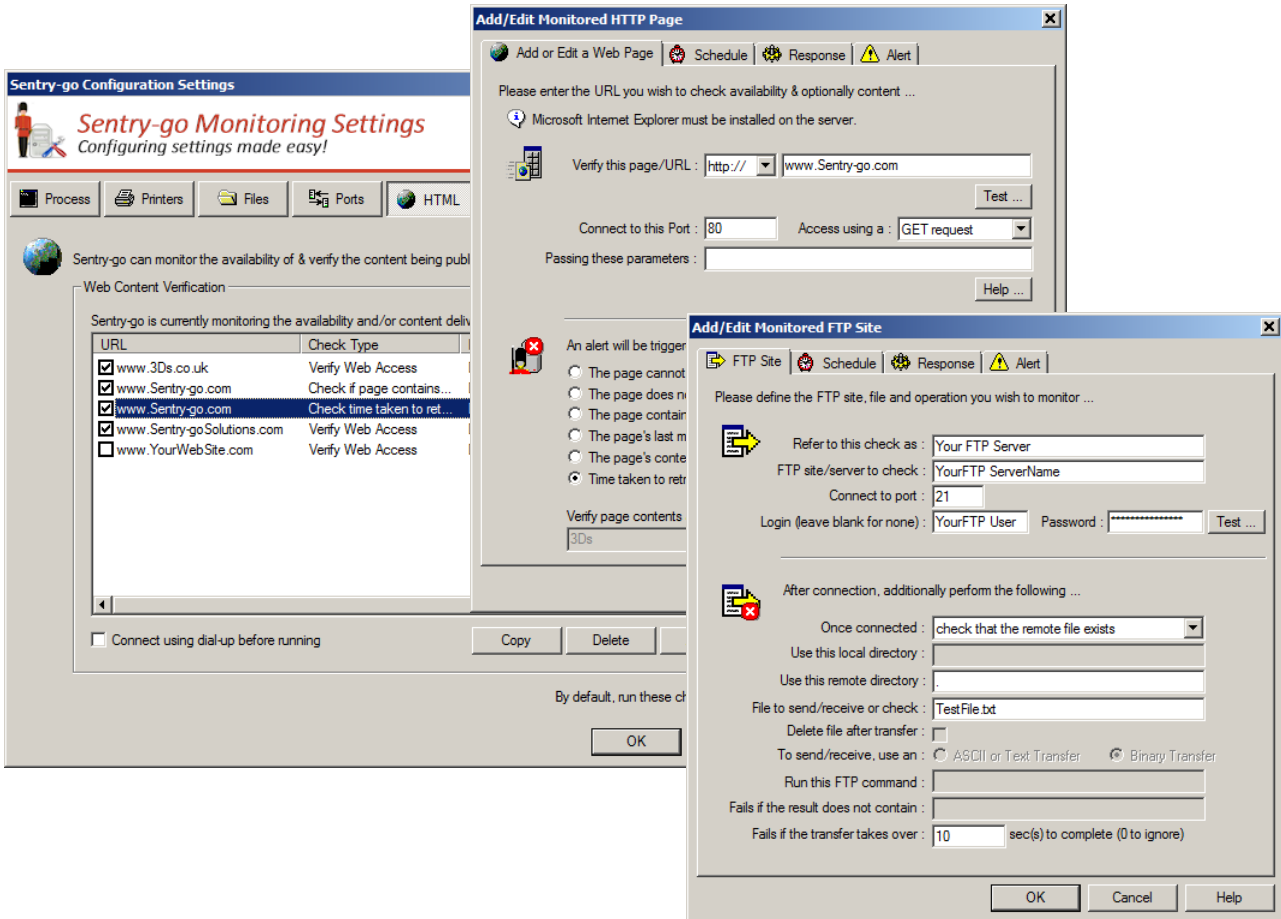

Web server, ASP & web service performance can all be monitored as can the server itself to ensure its both running correctly and is not being overloaded by unexpected behaviour.

If errors are written log files or the event log, Sentry-go can let you know within a few seconds. Disk space too can be monitored to ensure temporary space for uploads etc. isn't running low.

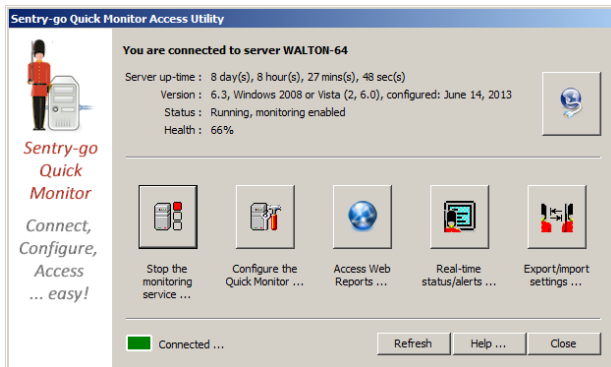

When errors are detected, the monitor can respond automatically, or you can be notified immediately using a number of alerting methods such as e-mail, SMS or network message. Real-time information is available through desktop tools or from your web browser using the built-in web server. Add the Enterprise Option to keep track of all your Sentry-go monitors from single reports.

Checking web & FTP access and much more ...

Configuring web & FTP checks is as easy as accessing the page from your desktop. Simply tell the monitor which sites you wish to check and which checks you wish to perform and the Quick Monitor will schedule these tests automatically. Settings can easily be synchronised between monitors to ensure consistency throughout your enterprise.

Quick & easy to use

With the Quick Monitor's client tools, controlling, configuring and accessing the monitor is easy & intuitive, either locally or remotely from your desktop.

Alerts allow you to be notified of any detected issues quickly and in a way convenient to you, while the built-in web server gives you direct access to the monitoring engine from your web browser.
